REVISED FINAL SUPPLEMENTARY SOIL ASSESSMENT WORK PLAN FOR METALS,
PACIFIC AIRMOTIVE CORPORATION AT 2940 NORTH HOLLYWOOD WAY, BURBANK,
CALIFORNIA (FILE NO. 104.0812)

This letter is in reference to the November 15, 1999 revised work plan, prepared by your consultant, Harding Lawson Associates (HLA), for conducting a soil investigation to assess potential metal sources at the subject site. This work plan was revised based on information concerning historical site activities and a site inspection conducted by Regional Board and HLA staff on October 21, 1999.

The subject work plan may be implemented provided the work is performed as proposed and the following comments are addressed:

1. Collect the first soil sample approximately 1 foot bgs in the former Parts Cleanup Line area and former sump.
2. Analyze the soil samples for hexavalent chromium if the total chromium concentration detected in any sample exceeds ten times the Soluble Threshold Limit Concentration (STLC) for hexavalent chromium. These substances were noted in a 1986 hazardous substance inventory for the subject facility.
3. Conduct a Waste Extraction Test (WET) according to California Administrative Code Title 22 if the concentration of any metal exceeds ten times the STLC value for the metal. The purpose of the WET is to determine the amount of extractable substance.

We suggest archiving the soil samples as a contingency in the event that further metal analysis is needed. The report describing the results of this site investigation must be submitted to this Regional Board by **December 31, 1999**. Regional Board staff may require additional assessment based on the results of this investigation.
